Rifiniture: Indicazioni tecniche

Avvertenze e indicazioni di posa e manutenzione

Per una ottimale durata delle copertine nel tempo, è consigliabile effettuare, dopo la messa in opera, un trattamento protettivo dell'intera superficie e del toro laterale esposti alle intemperie, qualsiasi esse siano, con un prodotto idrorepellente/traspirante di qualità specifico per l'esterno, assicurandosi di stendere lo stesso anche sugli stucchi. Il protettivo deve essere trasparente, steso uniformemente secondo le istruzioni del produttore. Pulire accuratamente la copertina prima della stesura degli stucchi, assicurando che non vi sia sporco in generale. I nostri manufatti, essendo prodotti con inerti naturali provenienti da cave della nostra zona, potrebbero presentare delle leggere stonalizzazioni, pertanto non può considerarsi difetto la presenza di tali lievi variazioni di colore, eventuali efflorescenze (considerato fenomeno naturale), piccole sbecature degli elementi (considerate normali e da stuccare in opera). L'idrofugo presente nell'impasto del coprimuro non garantisce la perfetta impermeabilità. I reclami possono essere presentati solo prima che il materiale sia messo in opera. In ogni caso, la nostra responsabilità si limita alla sola sostituzione dei prodotti riconosciuti difettosi e non riguarda le spese di posa e rimozione.

Posa in opera

Fig. A)

Rimuovere accuratamente polveri e residui. Accertarsi che non siano presenti dislivelli nella parte superiore del muro di posa, tipo "creste" di calcestruzzo o quant'altro.

Fig. B)

Utilizzare collanti appositi per esterno, seguendo le istruzioni del produttore. Tenere tra elemento ed elemento una distanza minima di 1,5/2 mm. Stuccare elemento/elemento anche nei bordi laterali con stucco di qualità da esterno seguendo le istruzioni del produttore. Non utilizzare manta cementizia come stucco.

Fig. C)

Assicurarsi che vi siano almeno 5 mm di aria nella parte sottostante tra intonaco e terminale/ gocciolatoio.

Fig. D)

In caso di installazione di una recinzione sul coprimuro, assicurarsi di lasciare uno spazio di movimento tra il corpo installato e il perimetro del foro. Riempire il foro con un apposito sigillante elastico per esterni che prevenga la rottura del coprimuro in caso di eventuale dilatazione della recinzione nel tempo.
